

Promises of multi-material fiber devices for advanced light delivery systems

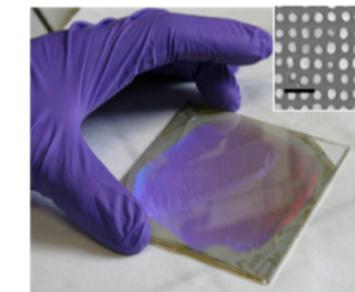

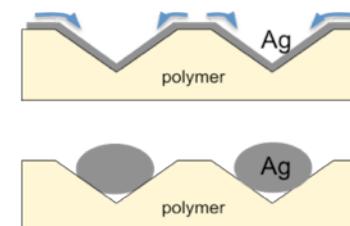

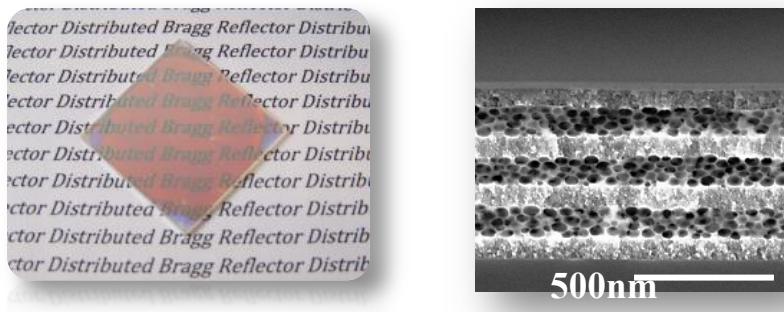

Fabien Sorin

Assistant Professor
Photonic Materials and Fiber Devices (FIMAP)
Institute of Materials (IMX)

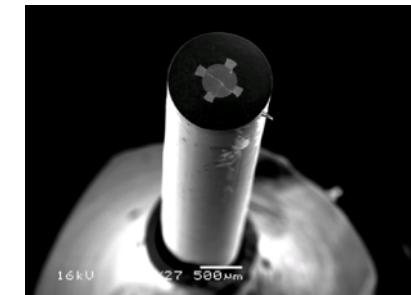

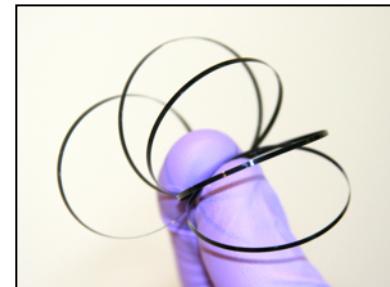

Interplay between the viscous flow and intermolecular forces to integrate complex functionalities within unconventional substrates

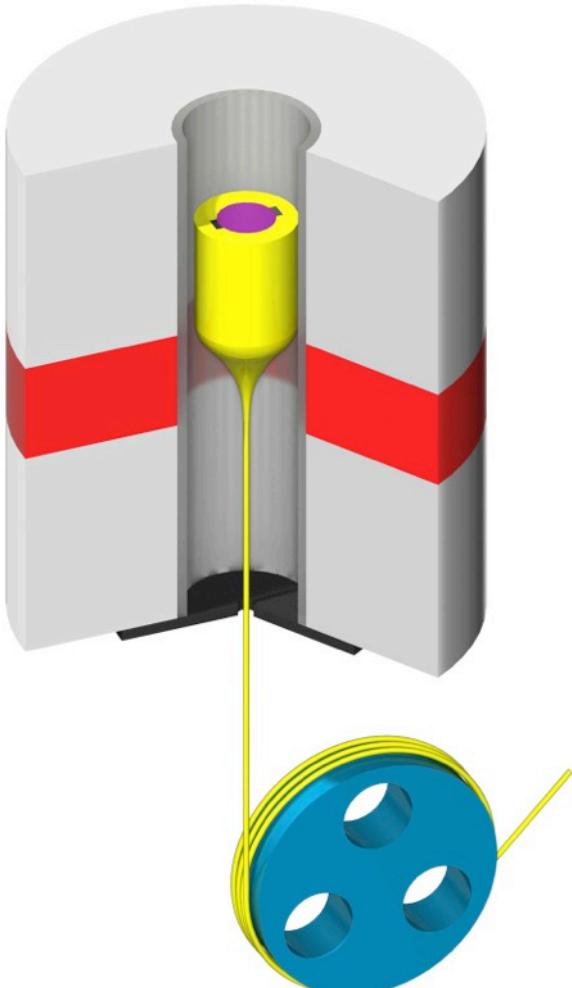

- Multi-material nanostructured 2D and 3D coatings

- Multi-material 1D fibre devices

- Professor Kao received the Nobel Prize in Physics in 2009 for the development of optical fibers
Glasses have low optical losses AND can be processed efficiently into fibers

Thermal drawing process

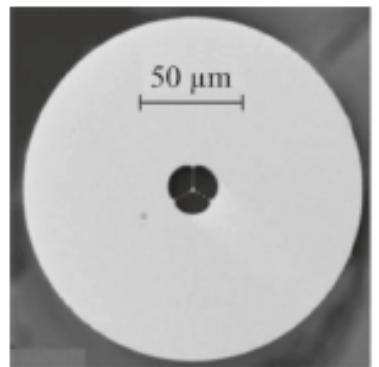

From optical fibres....

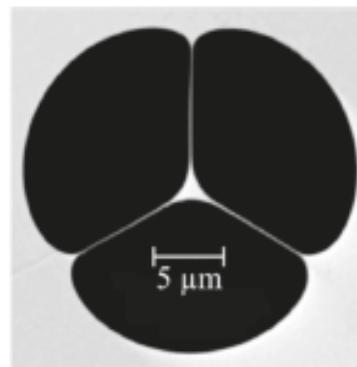

- Optical transport
- Sensing and monitoring

.... to a unique materials processing opportunity

- Simple, scalable, low-cost
- Unique micro-structures
- Distributed functionality
- Flexibility

Langmuir 27, 5680 2011

Photonic devices require an index contrast

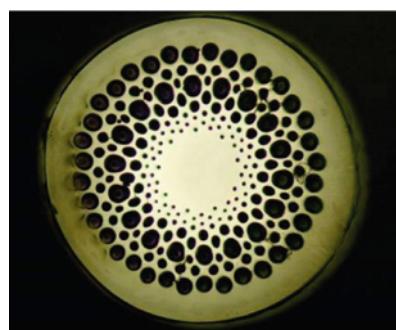

Different materials with different optical and thermo-mechanical properties

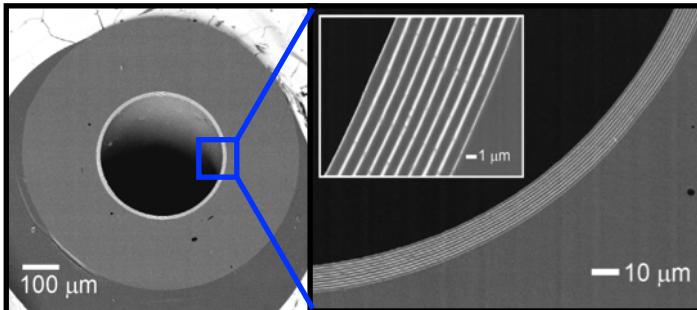

Effects of surface tension

(the process generates surface area)

Xue et. al. J. Light Wave 2004

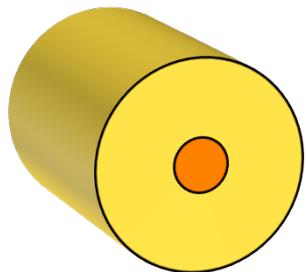

Nature 420, 650 (2002)

A rich material process

Extremely fine structures over extended flexible lengths

Engineering novel 1D nanostructured devices

Conventional fibers

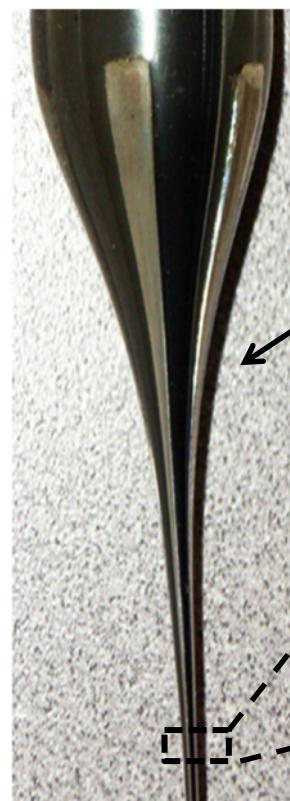

- 1 m long, 300 mm in diameter preform pulled into tens-of-kilometer long fiber
- Such fiber would cover 10 to 100 square meters !!

Single material
Simple geometry
Large feature sizes

Materials

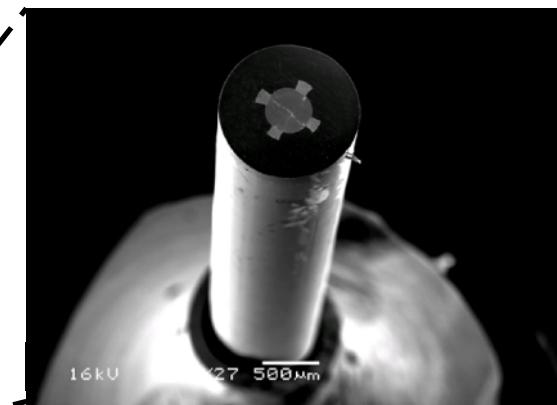

Structure

Length scale

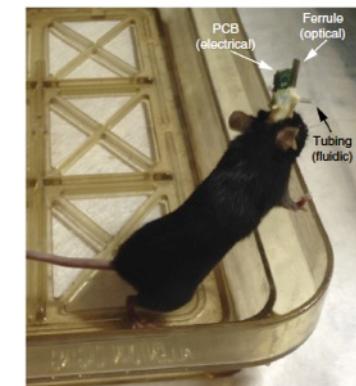

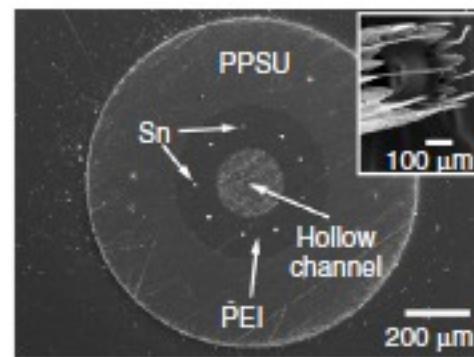

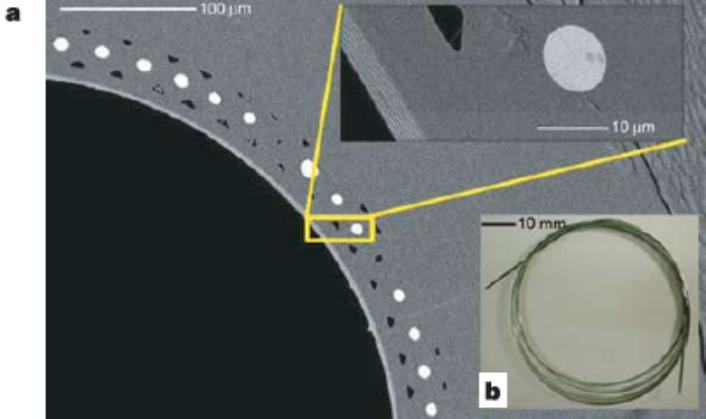

← Manufacturing on the preform level

Heat and draw down

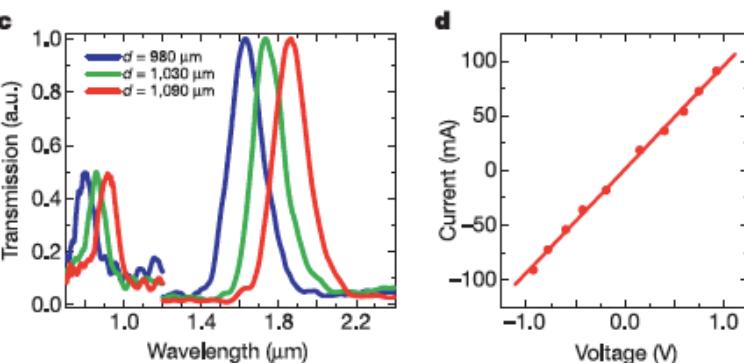

→ Extended length of functional fibers

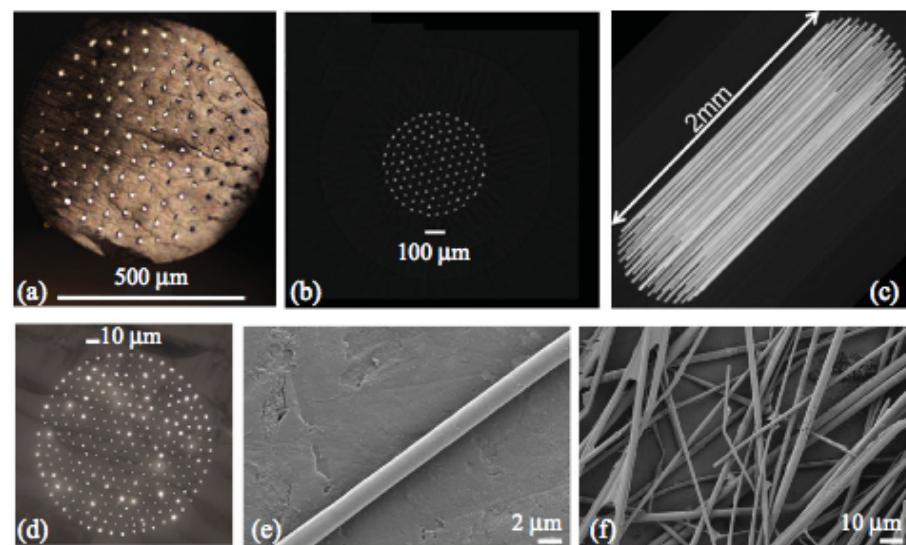

In-fiber metallic systems

Canales et. al., Nature Biotechnology (2015)

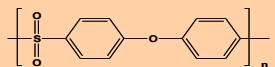

Bayindir, Sorin et. al. Nature 431, 826 (2004)

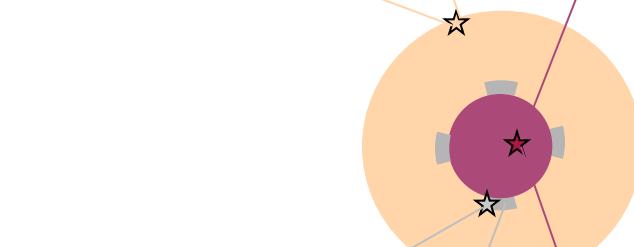

Adv. Optical Materials 1, 971 (2013)

HIGH-T_g TERMOPLASTICS

- Electrical Insulators
- PES, PEI
- Amorphous thermoplastics
- Glass transition temperature: 150-240 °C
- Refractive index @1.5 microns: 1.6
- Availability: Thin films (8-150 microns)

METALS

In, Sn, Bi(43%)-Sn(57%)

- Metals
- Crystalline Materials
- Melting Temperature: 140-232 °C
- T_m has to be lower than the drawing temperature
- Good wetting of glass and polymer
- Use of Flux to prevent oxidation
- Low viscosity at drawing Temperature

AMORPHOUS SEMICONDUCTORS

As, Se, S, Ge, Te, Si, Sn

- Amorphous semiconductors (p-type)
- Glass transition temperature: 160-210 °C
- Refractive index @1.5 microns: 2.4-3.4
- High electrical conductivity
- CTE for As₂Se₃: 25*10⁻⁶/C
- Photoconductivity

Preform cross section

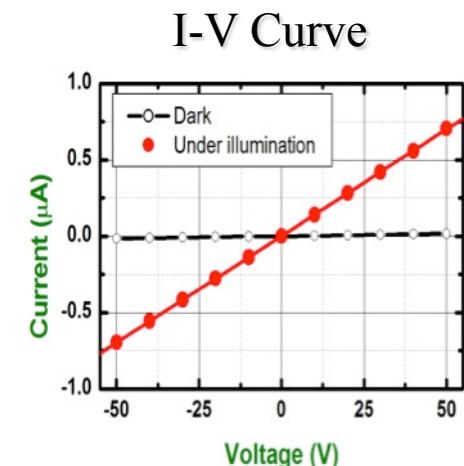

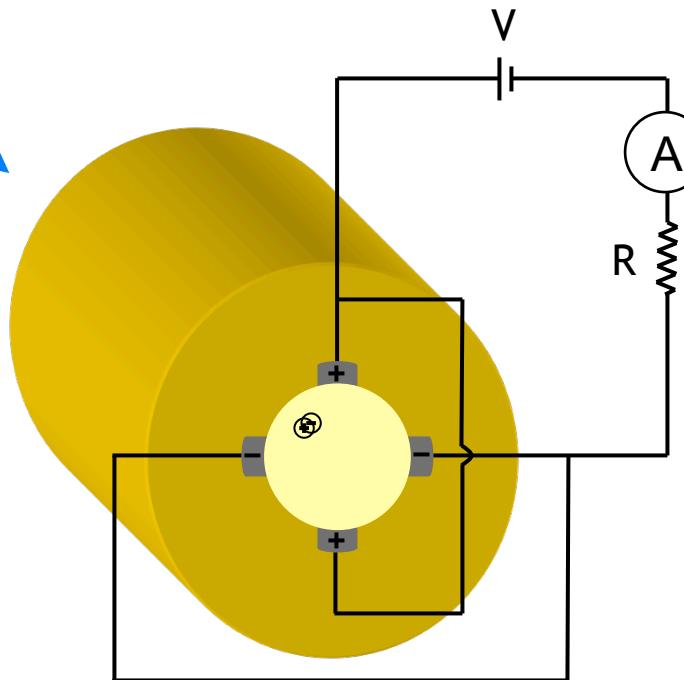

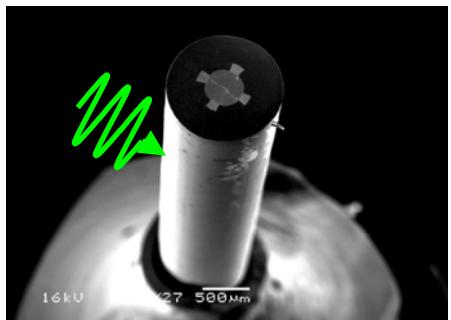

Fiber cross section

Draw-tower

The thermal drawing process inherently generates surface area !

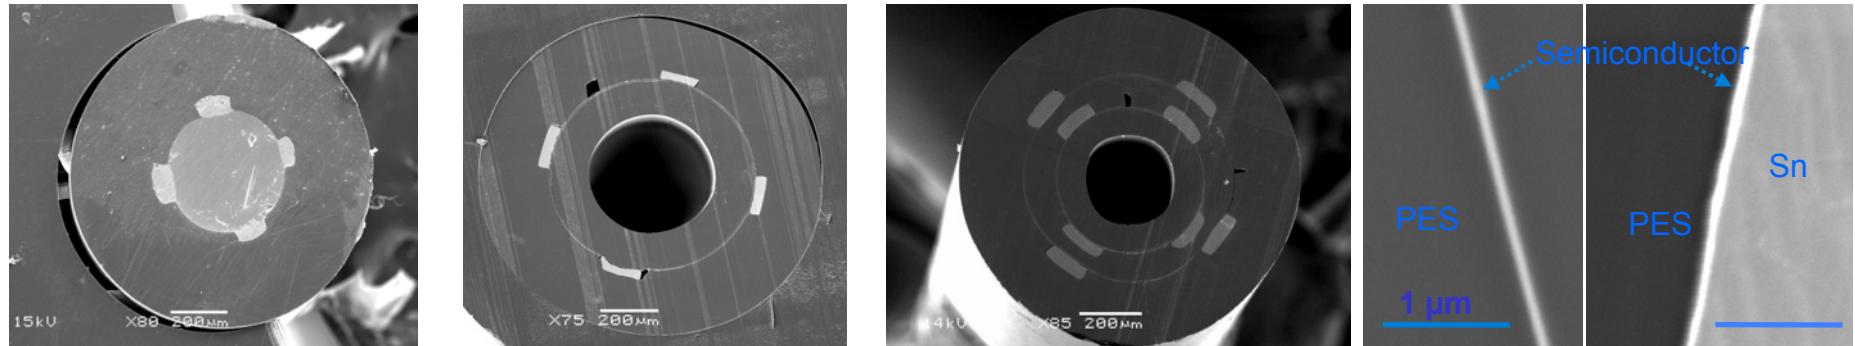

We have already made a photoconductor

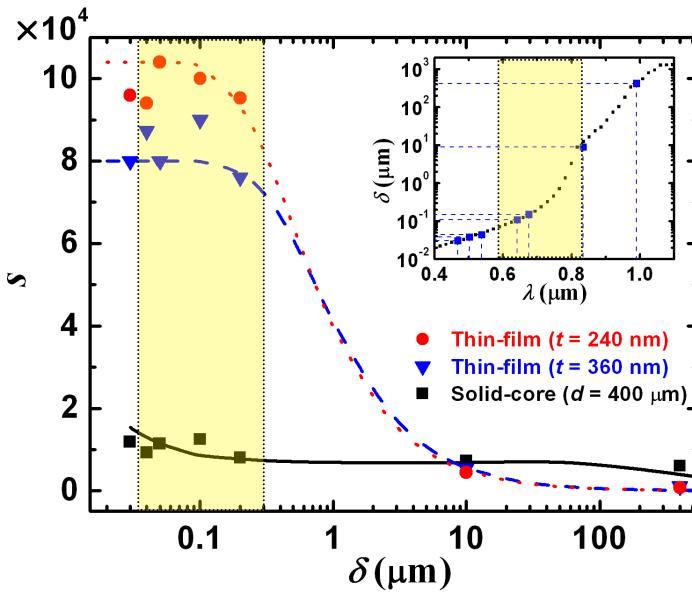

Extremely large area flexible optoelectronic devices

Can we integrate increasingly complex and innovative device structures ?

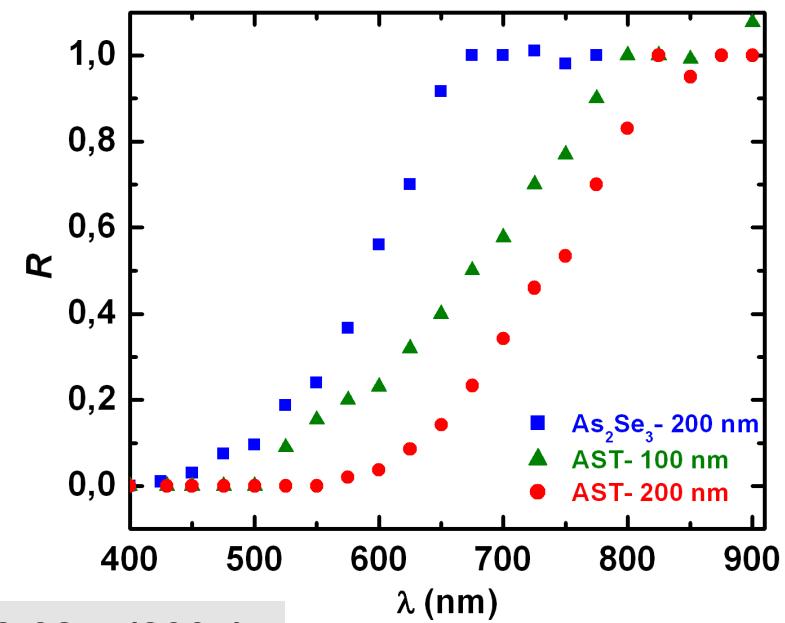

A change of architecture can lead to significant improvement in performance

SENSITIVITY vs PENETRATION DEPTH

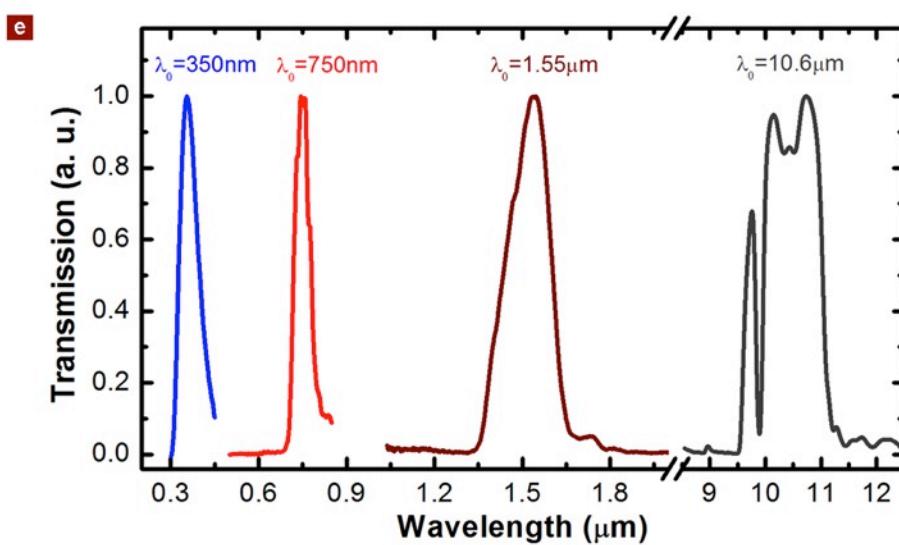

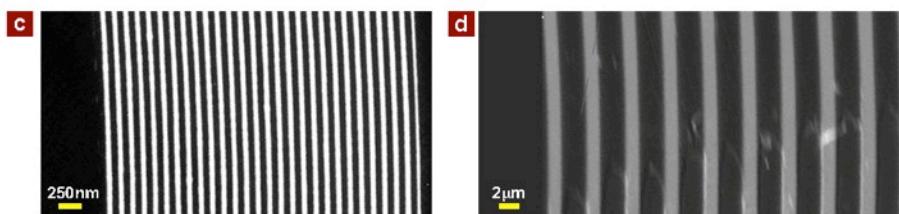

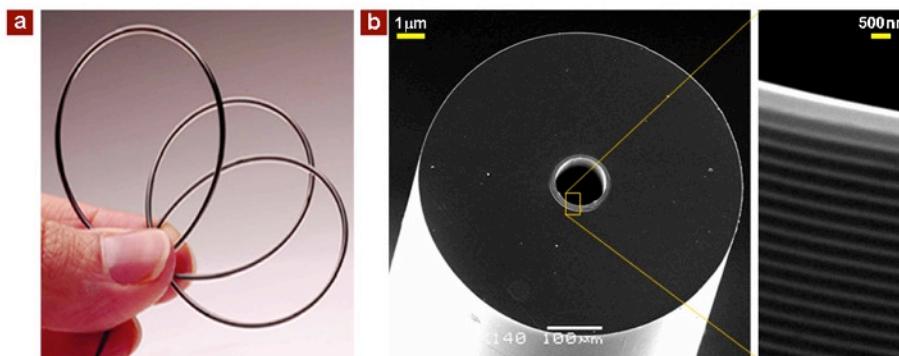

PHOTOCURRENT RATIO vs WAVELENGTH

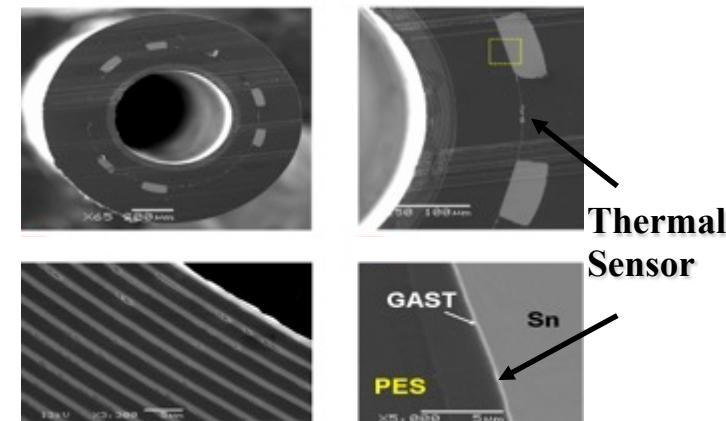

F. Sorin et al, Advanced Materials, 19(22) pp. 3872-3877(2007)

F. Sorin et al, NanoLetters 9 (7), pp.2631-2635 (2009).

Distributed heat sensing for safety monitoring

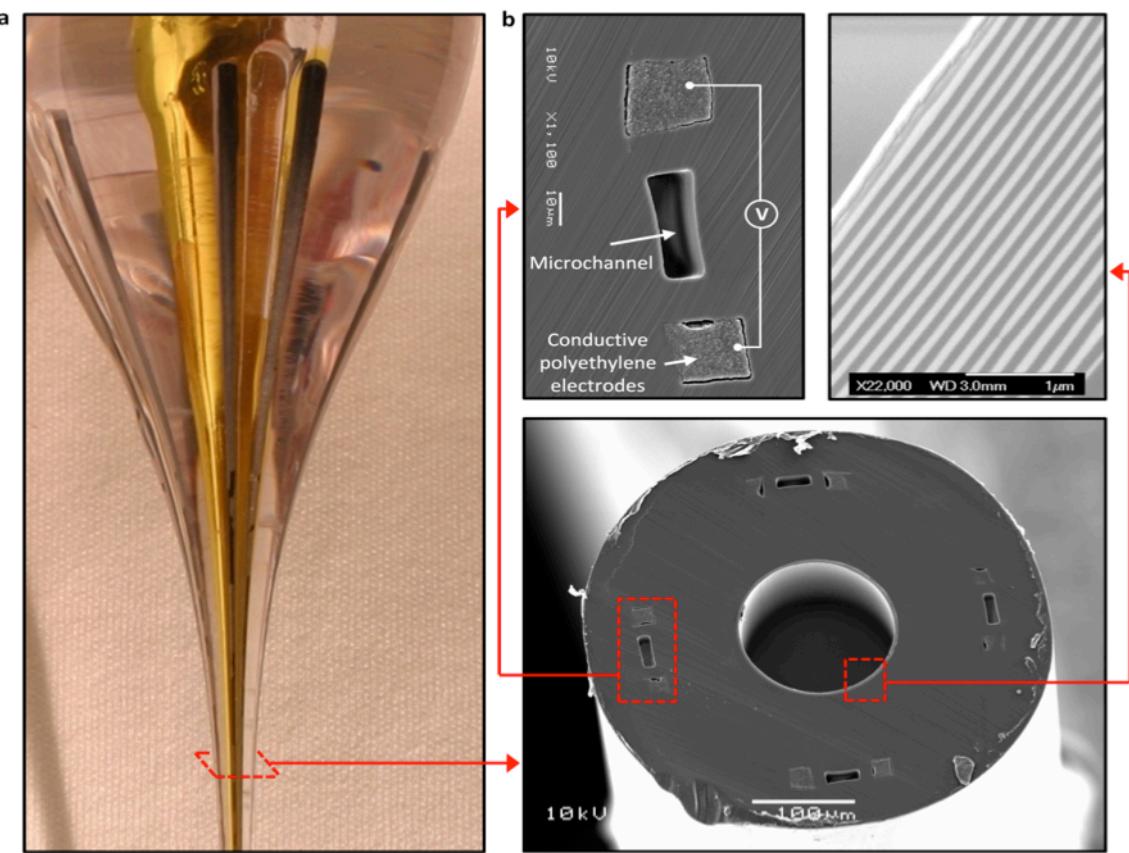

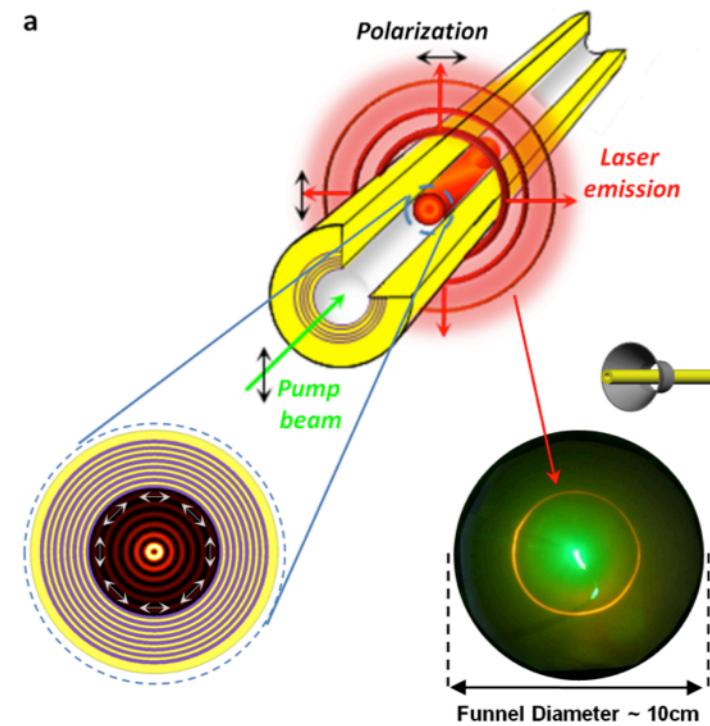

OmniGuide CO₂ Laser Beam Delivery System for non-invasive surgery

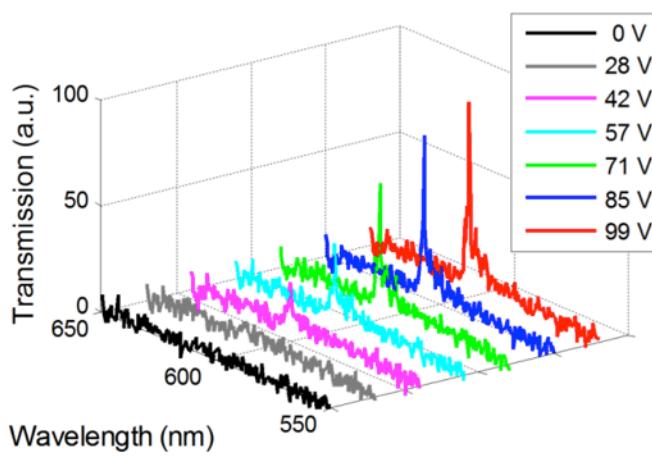

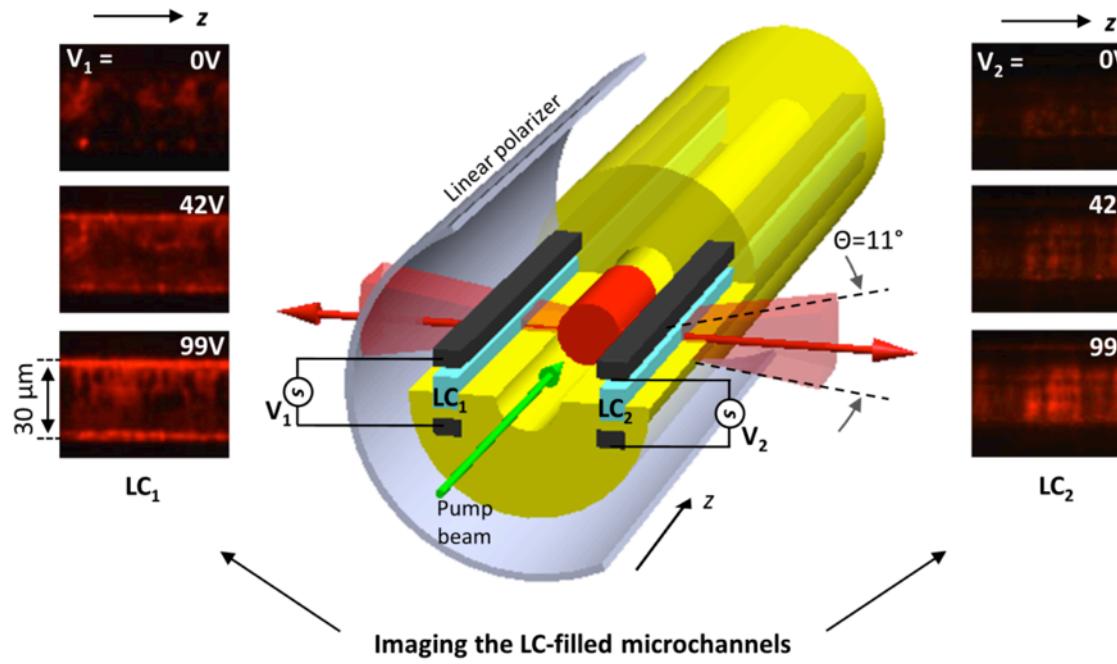

(Patent licensed by Omniduide Inc)

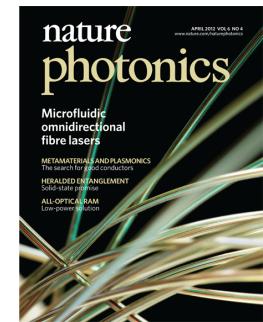

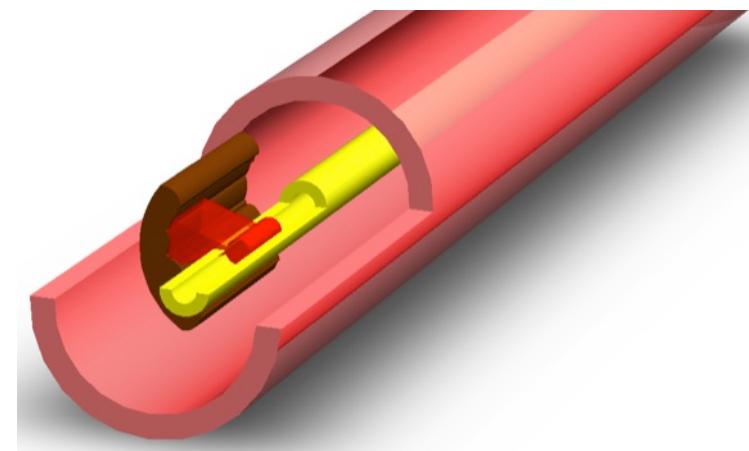

- We demonstrated surface emitting fiber lasers
- Using our multimaterial fiber platform, we could add liquid crystal filled channels
- Another example of integration of complex and different functionalities.

Microfluidic transverse fiber lasers

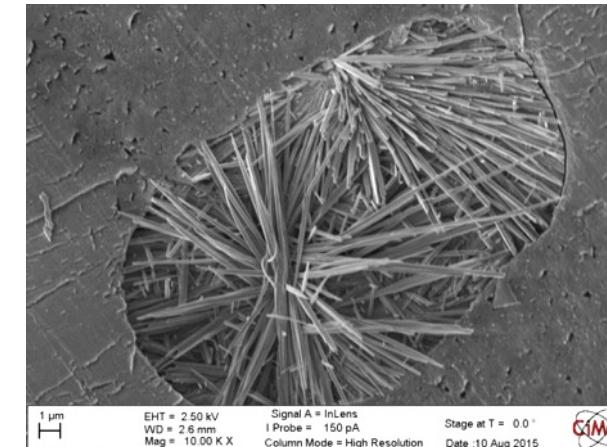

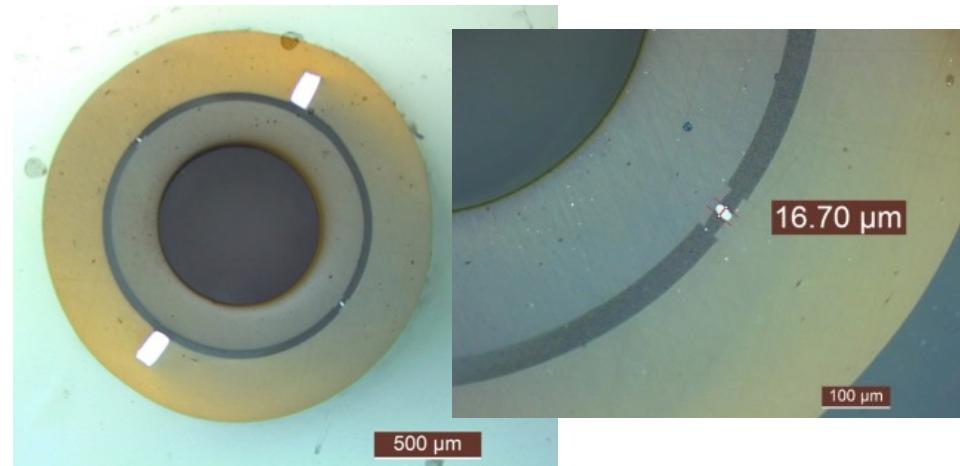

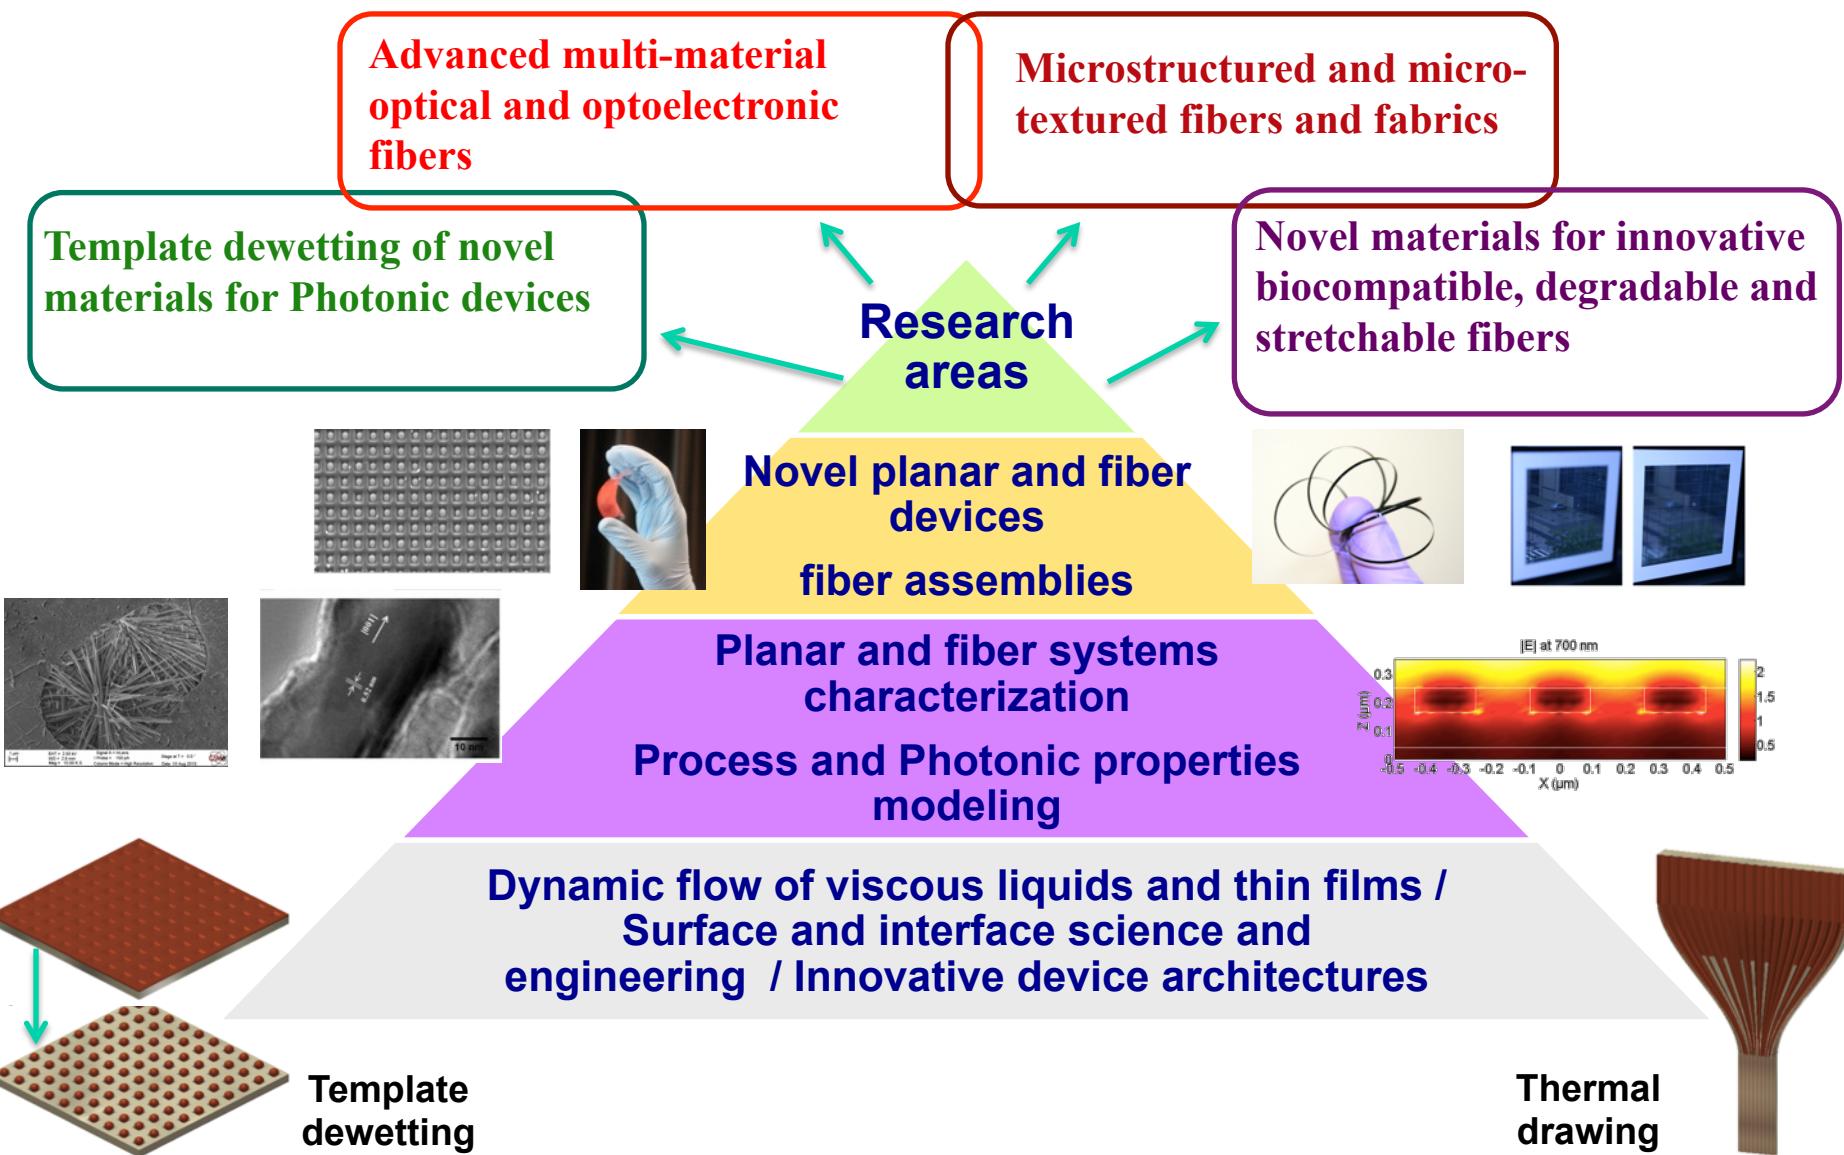

Directional light based activation of photosensitive compounds.
